PRIVATE-COMPANY DILIGENCE

## Private-company research, grounded in evidence.

Perspiciil screens private companies with a deterministic scoring model. Public research scores reflect available evidence and coverage. They are not validated default predictions or formal credit ratings.

Not a live report

**Evidence-gated scoring**  
Missing evidence stays missing. Source quality, coverage, and supporting-signal limits constrain the research score.

**Transparent provenance**  
Every signal names its source, observation date, and entity-match confidence. Nothing is invented to fill gaps.

**Peer comparison**  
Compare up to four companies side by side under the same model and spot outlier risk faster.

**Persistent workspace**  
History, watchlists, saved reports, and settings stay tied to your account across sessions.

Perspiciil is a research tool and does not provide credit, investment, legal, or lending advice.

**Evidence-based screening with transparent sources,  
coverage and confidence.**

# Private-company underwriting still depends on stale, fragmented evidence.

The companies most lenders, investors, vendors, and insurers need to evaluate rarely publish fresh financials. Teams compensate with manual diligence, PDF uploads, anecdotes, and slow data pulls.

- Lenders need cash-flow health before extending credit.
- Investors need early operating signals before outreach.
- Vendors need customer risk before giving payment terms.

Market figures and diligence duration are founder-supplied context, pending source verification.

# Perspiciil Score organizes available company evidence

[11 score definitions](#)[0-1000 score](#)

A 0-1000 research score with separate coverage and confidence. Missing data stays unavailable. No validated default prediction or formal credit rating.

Financial evidence  
SEC facts; licensed data planned

Operating context  
Public profiles; hiring unavailable

Identity and legal evidence  
GLEIF context; legal feeds planned

Public sentiment  
News and public discussion

Data boundaries  
Missing data stays unavailable

Six public-track definitions, including unavailable hiring, and five licensed definitions. GLEIF and Census provide context only.

## Evidence and workflow in one workspace

Search companies, inspect provenance and compare peers. Scores can remain unavailable when evidence fails the release gates.

- Score, confidence and coverage stay distinct.
- Source availability and evidence dates are visible.
- Up to four companies in a peer comparison.

## Team workflow implementation

Organization roles and isolated reports

Asynchronous screening with job status

Scoped customer API and revocable keys

Scheduled monitoring with delivery history

TOTP MFA and policy review

Release branch: backend activation and staging verification required before production use.

# Public evidence today, licensed data subject to agreement

Public adapters return evidence when reachable and matched. Licensed feeds remain disabled until contracts, permissions and credentials are approved.

**No simulated evidence  
in published scores**

**NOT VALIDATED ON  
REAL OUTCOMES**

## Public adapters

- SEC EDGAR
- Wikipedia
- GLEIF / optional Census context
- DuckDuckGo + HackerNews
- USASpending

## Licensed, not activated

- Consent-based financial data
- Business identity / standing
- Liens and litigation
- Commercial credit evidence
- B2B payment behavior

# Target customers and proposed pricing model

The proposed wedge is a screening workspace and customer API for teams deciding where to spend analyst time. Target segments below do not imply existing customers or revenue.

## Lenders

Company research and  
scheduled portfolio review

## Investors

Search funds, PE sourcing, sponsor  
diligence

## Vendors

Payment terms, customer  
concentration, receivables risk

## Monetization path

Proposed: dashboard seats, company bundles, API access and scheduled alerts. Pricing and willingness to pay remain untested.

# The ask: fund licensed-data integration and evaluate real diligence outcomes

The next year targets approved data access, design partners and measured diligence throughput. Predictive validation requires lawful historical outcome data.

## 0-90 days

Contract approved data access and test integrations

## 90-180 days

Run design-partner pilots and measure workflow outcomes

## 180-365 days

Evaluate paid API and monitoring with repeat pilot partners
